About me

Born on January 19, 1993,

FullStack Developer

Passionate for details & simplicity. Love for music, art, design, nature & travel.

Skills

Javascript, Reactjs, React Native, Redux, Typescript, HTML, CSS, Webpack, Storybook, Material UI, Jest, React Testing Library, Object-Oriented Design, REST, SQL, Nodejs, Express, PHP, Git, GitHub Actions CI/CD, Semantic Release, Scrum Agile methodology, Figma.

Currently learning NextJS.

Experience

Sovos Compliance / Software Developer
DECEMBER 2018 - SEPTEMBER 2021, Tucumán, Argentina

SOVOS is a company dedicated to the automation of tax calculations mainly in the US. There I've worked developing and maintaining different types of applications. I've mostly done front-end work, but I've also adapted to the company's needs by doing some back-end and testing.

During the time that I was in the company, I participated in two teams. In the first one, we develop internal tools that show statistics of automated test results for all the company's product lines. In the second, we kept the main product provided by Sovos (TIR). In addition to developing new features and maintenance, I became the owner of the main front-end repository for the application, so I had to go through numerous PRs that involved extensive code reviews and design decisions that made me grow not only in terms of technology but also in the way you treat others and organically discuss the best way forward.

Leniolabs / Software Developer
SEPTEMBER 2020 - APRIL 2022, Remote

In my time with Lenio, I mainly did front-end work. We have worked with clients in the US, especially with ICE (formerly Ellie Mae) dedicated to home loans automation. The main application I was involved with was the Admin Portal, which is in charge of managing multiple configurations of generic applications: one is a CMS that allows the user to create a web page based on certain configurations and templates; the other was a web application called the Loan App that allows the end user to submit/apply for a home equity loan. Most of the time we worked in the admin portal as we were migrating from AngularJS to React consuming and interacting with a custom UI library developed by the enterprise called dimsum

(through storybook). That was really challenging as we had to take a deep look at business logic implemented years ago and pretty much develop a new app from scratch.

Freelance / Software Developer
JANUARY 2018 - NOW, Remote

Worked as a freelancer, developing all kinds of applications including Mutual Congreso, BonusTicket, and Claro. I've done most of the front-end work in these apps but also designed database structures and part of the back-end. The main idea for most of the apps was to increase added value for the client's business.

I have also developed a small pokemon related application. This project aimed to create an npm React UI components library (with storybook) and consume it from the app to showcase a pokemon list with all details. Within this project, I've also implemented yml pipelines for CI/CD through GitHub Actions including semantic release. Added unit testing coverage as well. The application deployed through GH pages: ledesma-app. You can check the public repositories on my GitHub account (ledesma-app, ledesma-lib).

Currently, I'm working on a portfolio re-design for a Brazilian actor based in Berlin with the purpose to increase his potential and also improve my UI/UX knowledge. You can check the progress on Figma danilo-figma and my GH account.

Finally, I worked hard on my portfolio where I mix my passions for music, art, and coding fl-portfolio.

Education

High School / Technical Accounting Bachelor's
1998 - 2010, Tucumán, Argentina

Fasta Ángel María Boisdron School

Higher Education / Computer Engineering
2011 - 2018, Tucumán, Argentina

National University of Tucumán

Idioms

Native Spanish

Advanced English
